secure and efficient authentication for cloud computing

Identity based Encryption provides a public key encryption mechanism where a public key is an arbitrary string such as an email address or telephone number . The corresponding private key can only generated by a private key generator (PkG) who has knowledge of a master secret . The concept of revocable identity based Encryption (RIBE) might be a promising approach that fulfills the mentioned security requirements for data sharing .RIBE features a mechanism that enables a sender to append the current time period to the cipher text such that receiver can decrpt the cipher text only under the conditions that user not revoked at that time period .
